4.2. VISION ZERO PAVLODAR (URBAN PLANNER POSITION, ASTANA, KAZAKHSTAN 2021-2022)

In Pavlodar, from January to August 2021, 13 people died, and 282 were injured on the roads. In 2020, the city saw 15 fatalities and 700 injuries. Therefore, it was an urgent to improve the situation via introducing new programme. In 2020, 6 out of 65 road fatalities in the Pavlodar region were children under 18, and 161 children were injured in traffic accidents.

This plan **was designed to improve road safety** and efficiency to protect the population. Traditionally, in post-socialist countries, transportation efficiency focuses on road infrastructure capacity and vehicle numbers, but international standards **prioritize population mobility and access to public transportation.**

The global priorities for creating comfortable, safe, and accessible cities **emphasize life and improving living standards.** By implementing this plan, traffic fatalities and injuries should be reduced by at least 30%. In addition, the Plan emphasized safety, friendliness, and accessibility in planning for pedestrians and transport near public and socially significant facilities.

This project was partially implemented in some streets redevelopment projects.

My role was to do the research and develop the report. This reports has 65 pages. This project was developed in Russian.
